R Markdown

Load data

We will use Iris dataset which is already built in R, and is about flowers

```
data(iris)
dataset <- iris</pre>
```

Split data to train and test (validation)

```
# create a list of 80% of the row indees in the original dataset we can use for training
validation_index <- createDataPartition(dataset$Species, p=0.80, list=FALSE)
# select 20% of the data for validation
validation <- dataset[-validation_index,]
# use the remaining 80% of data to training and testing the models
dataset <- dataset[validation_index,]</pre>
```

a little summary of the data

dimensions

```
dim(dataset)
```

```
## [1] 120   5
```

Types of each variable

```
sapply(dataset, class)
```

```
## Sepal.Length Sepal.Width Petal.Length Petal.Width Species
## "numeric" "numeric" "numeric" "factor"
```

how the data looks like

```
head(dataset)
```

```
##
     Sepal.Length Sepal.Width Petal.Length Petal.Width Species
## 1
              5.1
                          3.5
                                        1.4
                                                    0.2 setosa
## 2
              4.9
                          3.0
                                        1.4
                                                    0.2 setosa
              4.7
## 3
                          3.2
                                        1.3
                                                    0.2 setosa
## 4
              4.6
                          3.1
                                        1.5
                                                    0.2 setosa
## 6
              5.4
                          3.9
                                        1.7
                                                    0.4 setosa
## 8
              5.0
                                        1.5
                          3.4
                                                    0.2 setosa
```

as species is factor, lets take a look at its levels

```
levels(dataset$Species)
```

```
## [1] "setosa" "versicolor" "virginica"
```

so we see a multi class data, not binary

lets take a look at the class distribution of each classes

```
#percantage of each class
percentage <- prop.table(table(dataset$Species)) * 100

cbind(freq=table(dataset$Species), percentage=percentage)</pre>
```

```
## freq percentage
## setosa 40 33.33333
## versicolor 40 33.33333
## virginica 40 33.33333
```

so we see that each class is represented equally

Statistical summary of the dataset

```
summary(dataset)
```

```
##

```

Lets make some visualization

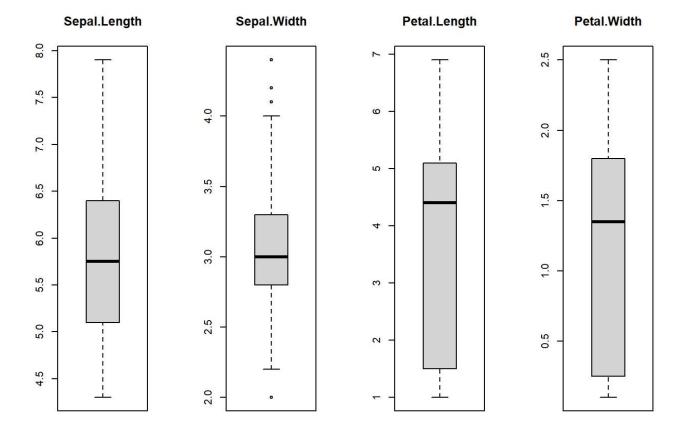

Univariate (one variable) plots

```
#independent variables to x
x <- dataset[,1:4]

#dependent variable to y
y <- dataset[,5]</pre>
```

lets see the distribituon of independent variables

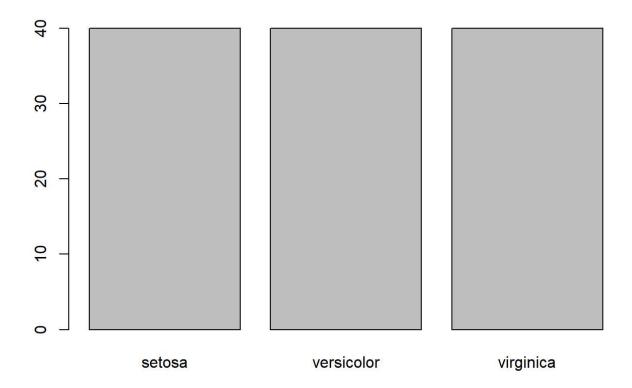

```
#this is for setting the number of boxplots
par(mfrow=c(1,4))
  for(i in 1:4) {
  boxplot(x[,i], main=names(iris)[i])
  }
```

#gvisualization of each 4 variable with for loop
#took the names of each boxplot from iris object which is already defined

we have the dependent variable as y so lets see its distribution of its different classes

plot(y)

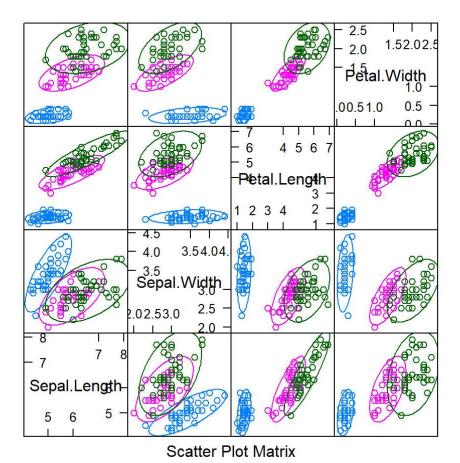

they are equal as we have seen earlier

Multivariate Plots (relationship of variables btw each other)

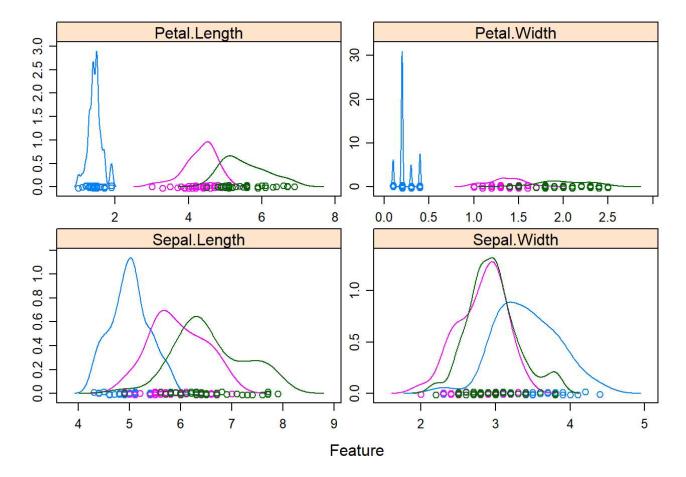

ScatterplotMatrix

featurePlot(x=x, y=y, plot="ellipse")

Distribution of each variable with density plot

```
# density plots for each attribute by class value
scales <- list(x=list(relation="free"), y=list(relation="free"))
featurePlot(x=x, y=y, plot="density", scales=scales)</pre>
```

this gave us distribution of attributes for each 3 different classes

Making Predictions with 5 different models and evaluating them

We will use 10 fold cross validation and use accuracy as metric

```
control <- trainControl(method="cv", number=10)
metric <- "Accuracy"</pre>
```

We will build and make prediction with five different models which are:

Linear Discriminant Analysis (LDA) Classification and Regression Trees (CART). k-Nearest Neighbors (kNN). Support Vector Machines (SVM) with a linear kernel. Random Forest (RF)

```
# a) linear algorithms
set.seed(7)
fit.lda <- train(Species~., data=dataset, method="lda", metric=metric, trControl=control)
# b) nonlinear algorithms
# CART
set.seed(7)
fit.cart <- train(Species~., data=dataset, method="rpart", metric=metric, trControl=control)</pre>
# kNN
set.seed(7)
fit.knn <- train(Species~., data=dataset, method="knn", metric=metric, trControl=control)</pre>
# c) advanced algorithms
# SVM
set.seed(7)
fit.svm <- train(Species~., data=dataset, method="svmRadial", metric=metric, trControl=contro
# Random Forest
set.seed(7)
fit.rf <- train(Species~., data=dataset, method="rf", metric=metric, trControl=control)</pre>
```

Getting, summarizing and comparing results

```
results <- resamples(list(lda=fit.lda, cart=fit.cart, knn=fit.knn, svm=fit.svm, rf=fit.rf))
summary(results)</pre>
```

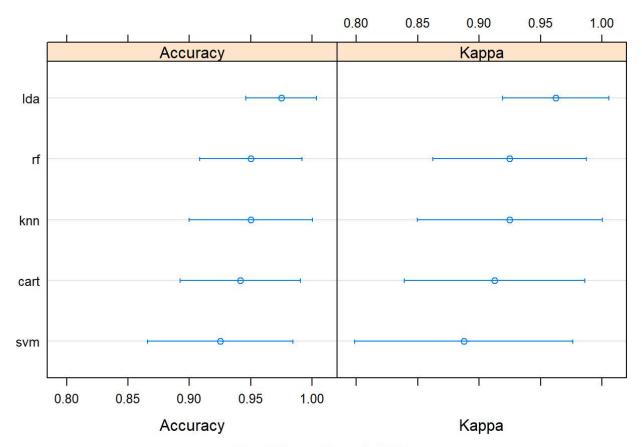

```

       0.750 0.87500 0.9375 0.9250
```

result shows us both accuracy metric results and another matric whic is kappa

both metrics shows us that the most accurate model is LDA

we can also visualize the result

```
dotplot(results)
```

Confidence Level: 0.95

we can also see the result for only LDA

```
print(fit.lda)
```

```
## Linear Discriminant Analysis

```

Now that we build the model, we can make predictions and test the results, thus we can see the accuracy of the model with our validation data set which our model did not see and learn yet

making prediction with Ida and seeing its accuracy with confusion matrix

```
predictions <- predict(fit.lda, validation)
confusionMatrix(predictions, validation$Species)</pre>
```

```
